Engineering and Hardware Layout
for Tempered Glass

Many of our customers buy tempered glass from Vitro America and then purchase hardware from other suppliers to fabricate doors, hand rails or custom shower doors. A significant part of the cost of fabricating these products is the engineering and testing that must be done to certify that the product works correctly. Vitro America regularly employs independent consulting engineers for this type of engineering and we bill those costs to our customer. Vitro America also purchases hardware from suppliers who assist us in determining proper layout and attachment procedures, rather than just quoting the lowest price.

For these reasons, Vitro America cannot assist our tempered glass customers with hardware layout or engineering calculations. The cost associated with this information is a normal cost of doing business. We will be glad to recommend sources where this type of information may be purchased.
